Mining the Bundestag: Political Sentiment Classification for German Language Text

A DeepLearning approach *

Tim Kreienkamp

ABSTRACT

Sentiment classification is an area of text mining that has been of considerable interest for researchers as well as practicioners. However, most work focuses on the classification of (online) opinions and perceptions towards products and services. In this paper, the author develops a Neural-Network ("Deep Learning") based approach to classify speeches in the German Bundestag by party affiliation.

1. INTRODUCTION

Text Mining and Natural Language processing are relatively new fields of Machine Learning. With the recent advances of artificial intelligence techniques, dubbed frequently as "Deep Learning", these fields have gained considerable traction. A sub-category, sentiment analysis (the inference of sentiments from text), has been studied extensively in research papers and Machine Learning competitions. Perhaps due to the availability of labeled data, a large fraction of this research focused on online reviews, be it product reviews (CITATIONS), movie reviews (e.g. Rotten Tomatoes, CITATION) or restaurant / venue reviews etc. An area where research is still quite sparse, is political speech. In this paper, the author uses a novel data set, the speeches held in the German parliament in the current legislative period, to build a classification model. The goal is to classify each speech according to the speakers' party.

2. BACKGROUND

As opposed to the American two-party system, the German political landscape is more diversified. Currently, there are four parties in the German parliament. The government is formed by a coalition of the CDU / CSU (Christian Democrats) and the SPD (Social Democrats). Together, they hold more than two thirds of available seats.

The opposition is made up of DIE LINKE (socialists) and BUENDNIS 90 / DIE GRUENE ("green", environmentally conscious party). Also, it's less clear-cut. While the christian democrats have traditionally conservative stance, in recent years, their orientation drifted more towards the social democrats. An extreme, recent example would be CDUpolitician Joachim Pfeiffer supporting marijuana legislation, an issue that was traditionally only supported by the green party and even then only while in the opposition. In general, what could be considered "right" in German politics could still be considered left in the United States. This ambiguity makes it harder for young people to find out which party bests represents their political interests. As a result, participation in elections has been low among young people eligible to vote, especially in recent years. Several initiatives have been set up to battle this political frustration in the young population. For example, the online tool "Wahl-o-mat" confronts the user with about 30 political statements. The user can select if they agree, disagree or don't care. Aditionally, they can rank the topics by their preferences. Each political party also answered these questions beforehand. At the end of the process, the user can then compare see to which extend the parties agree with her own views.

3. METHODS

3.1 Data Collection

The dataset collected from www.bundestag.de/plenarprotokolle and consists of 5274 speeches in the current legislative period. The distribution of speeches by party are visualized in Figure 1. To single out speeches from the unstructured protocol a string pattern matching / regular expressions in python were used. This collection method has flaws. Extensive spot-checks however, lead the author to the assumtion that about 90-95 % of the speeches were correctly parsed. Speeches that belong to a speaker that is a member of the presidium of the parliament are not included, since the presidium of the parliament has mostly administrative duties. The vice presidents, however do speak sometimes for their party. Thus, this is another small source of noise.

3.2 Preprocessing

3.2.1 Inline (In-text) Equations

A formula that appears in the running text is called an inline or in-text formula. It is produced by the **math** environment, which can be invoked with the usual **\begin**. .

.\end construction or with the short form \$. . .\$. You can use any of the symbols and structures, from α to ω , available in LaTeX[?]; this section will simply show a few examples of in-text equations in context. Notice how this equation: $\lim_{n\to\infty} x=0$, set here in in-line math style, looks slightly different when set in display style. (See next section).

3.2.2 Display Equations

A numbered display equation – one set off by vertical space from the text and centered horizontally – is produced by the **equation** environment. An unnumbered display equation is produced by the **displaymath** environment.

Again, in either environment, you can use any of the symbols and structures available in L^AT_EX; this section will just give a couple of examples of display equations in context. First, consider the equation, shown as an inline equation above:

$$\lim_{n \to \infty} x = 0 \tag{1}$$

Notice how it is formatted somewhat differently in the **displaymath** environment. Now, we'll enter an unnumbered equation:

$$\sum_{i=0}^{\infty} x + 1$$

and follow it with another numbered equation:

$$\sum_{i=0}^{\infty} x_i = \int_0^{\pi+2} f \tag{2}$$

just to demonstrate LATEX's able handling of numbering.

3.3 Citations

Citations to articles [?, ?, ?, ?], conference proceedings [?] or books [?, ?] listed in the Bibliography section of your article will occur throughout the text of your article. You should use BibTeX to automatically produce this bibliography; you simply need to insert one of several citation commands with a key of the item cited in the proper location in the .tex file [?]. The key is a short reference you invent to uniquely identify each work; in this sample document, the key is the first author's surname and a word from the title. This identifying key is included with each item in the .bib file for your article.

The details of the construction of the .bib file are beyond the scope of this sample document, but more information can be found in the *Author's Guide*, and exhaustive details in the *BTFX User's Guide*[?].

This article shows only the plainest form of the citation command, using \cite. This is what is stipulated in the SIGS style specifications. No other citation format is endorsed or supported.

3.4 Tables

Table 1: Frequency of Special Characters

Non-English or Math	Frequency	Comments
Ø	1 in 1,000	For Swedish names
π	1 in 5	Common in math
\$	4 in 5	Used in business
Ψ_1^2	1 in 40,000	Unexplained usage

Immediately following this sentence is the point at which Table 1 is included in the input file; compare the placement of the table here with the table in the printed dvi output of this document.

To set a wider table, which takes up the whole width of the page's live area, use the environment **table*** to enclose the table's contents and the table caption. As with a single-column table, this wide table will "float" to a location deemed more desirable. Immediately following this sentence is the point at which Table 2 is included in the input file; again, it is instructive to compare the placement of the table here with the table in the printed dvi output of this document.

3.5 Figures

Like tables, figures cannot be split across pages; the best placement for them is typically the top or the bottom of the page nearest their initial cite. To ensure this proper "floating" placement of figures, use the environment figure to enclose the figure and its caption.

This sample document contains examples of .eps and .ps files to be displayable with IATEX. More details on each of these is found in the *Author's Guide*.

As was the case with tables, you may want a figure that spans two columns. To do this, and still to ensure proper "floating" placement of tables, use the environment **figure*** to enclose the figure and its caption. and don't forget to end the environment with figure*, not figure!

Note that either .ps or .eps formats are used; use the \epsfig or \psfig commands as appropriate for the different file types.

3.6 Theorem-like Constructs

Other common constructs that may occur in your article are the forms for logical constructs like theorems, axioms, corollaries and proofs. There are two forms, one produced by the command \newtheorem and the other by the command \newdef; perhaps the clearest and easiest way to distinguish them is to compare the two in the output of this sample document:

This uses the **theorem** environment, created by the **\newtheorem** command:

THEOREM 1. Let f be continuous on [a,b]. If G is an antiderivative for f on [a,b], then

$$\int_{a}^{b} f(t)dt = G(b) - G(a).$$

The other uses the **definition** environment, created by the **\newdef** command:

Definition 1. If z is irrational, then by e^z we mean the unique number which has logarithm z:

$$\log e^z = z$$

Table 2: Some Typical Commands

Command	A Number	Comments	
\alignauthor	100	Author alignment	
\numberofauthors	200	Author enumeration	
\table	300	For tables	
\table*	400	For wider tables	

Two lists of constructs that use one of these forms is given in the *Author's Guidelines*.

There is one other similar construct environment, which is already set up for you; i.e. you must *not* use a **\newdef** command to create it: the **proof** environment. Here is a example of its use:

PROOF. Suppose on the contrary there exists a real number L such that

$$\lim_{x \to \infty} \frac{f(x)}{g(x)} = L.$$

Ther

$$l = \lim_{x \to c} f(x) = \lim_{x \to c} \left[gx \cdot \frac{f(x)}{g(x)} \right] = \lim_{x \to c} g(x) \cdot \lim_{x \to c} \frac{f(x)}{g(x)} = 0 \cdot L = 0,$$

which contradicts our assumption that $l \neq 0$.

Complete rules about using these environments and using the two different creation commands are in the *Author's Guide*; please consult it for more detailed instructions. If you need to use another construct, not listed therein, which you want to have the same formatting as the Theorem or the Definition[?] shown above, use the \newtheorem or the \newdef command, respectively, to create it.

A Caveat for the T_EX Expert

Because you have just been given permission to use the \newdef command to create a new form, you might think you can use TeX's \def to create a new command: Please refrain from doing this! Remember that your LaTeX source code is primarily intended to create camera-ready copy, but may be converted to other forms – e.g. HTML. If you inadvertently omit some or all of the \defs recompilation will be, to say the least, problematic.

4. CONCLUSIONS

This paragraph will end the body of this sample document. Remember that you might still have Acknowledgments or Appendices; brief samples of these follow. There is still the Bibliography to deal with; and we will make a disclaimer about that here: with the exception of the reference to the LATEX book, the citations in this paper are to articles which have nothing to do with the present subject and are used as examples only.

5. ACKNOWLEDGMENTS

This section is optional; it is a location for you to acknowledge grants, funding, editing assistance and what have you. In the present case, for example, the authors would like to thank Gerald Murray of ACM for his help in codifying this Author's Guide and the .cls and .tex files that it describes.

APPENDIX

A. HEADINGS IN APPENDICES

The rules about hierarchical headings discussed above for the body of the article are different in the appendices. In the **appendix** environment, the command **section** is used to indicate the start of each Appendix, with alphabetic order designation (i.e. the first is A, the second B, etc.) and a title (if you include one). So, if you need hierarchical structure within an Appendix, start with **subsection** as the highest level. Here is an outline of the body of this document in Appendix-appropriate form:

A.1 Introduction

A.2 The Body of the Paper

A.2.1 Type Changes and Special Characters

A.2.2 Math Equations

Inline (In-text) Equations.

Display Equations.

A.2.3 Citations

A.2.4 Tables

A.2.5 Figures

A.2.6 Theorem-like Constructs

A Caveat for the T_FX Expert

A.3 Conclusions

A.4 Acknowledgments

A.5 Additional Authors

This section is inserted by LATeX; you do not insert it. You just add the names and information in the **\addition-alauthors** command at the start of the document.

A.6 References

Generated by bibtex from your .bib file. Run latex, then bibtex, then latex twice (to resolve references) to create the .bbl file. Insert that .bbl file into the .tex source file and comment out the command **\thebibliography**.

B. MORE HELP FOR THE HARDY

The sig-alternate cls file itself is chock-full of succinct and helpful comments. If you consider yourself a moderately experienced to expert user of LaTeX, you may find reading it useful but please remember not to change it.
